*Median Loading Capacity (MLC). The MLC is the approximate safe working load that can be applied to the clip, and in general terms determines the load bearing capacity of the "bridge" within the sleeve component – the bridge is stressed as the wedge is forced under it. The MLC is determined by the application of a series of static loading to the clip installed on a 24 oz vinyl fabric. Clips manufactured from grip/nylon polymer mix. The manufacturer and/or its agents make no claims as to the holding power or suitability of the products on the application on which they are being used and that the use of the product is the sole responsibility of the user.
